147 other activities. At such times the speed, skill and sureness of each motion, upon which the Indian's life so often depends, come fully to the fore.

The same is true of the women; in spite of their short stature, they are endowed with unusual physical endurance. [119]

482 In the course of their wanderings through the forest, they carry for several weeks at a time enormous baskets filled with heavy loads, with a child nearly always sitting on the top. In addition to all this, they bear in their hands heavy objects such as axes, iron pans, etc. They are, so to speak, the true bearers of the tribe; the warriors carry loads only when away from the women.

142 Their skin is of a dark tan color, lighter among the women.

Their hair is black, coarse and sleek.

164 Dental caries are widespread among them; as children their [753] teeth are already defective. They pull out a tooth as soon as it hurts, and this leaves them almost toothless quite early in life. It is a [64] curious fact that the warriors demand their wives (who are younger, and thus have better teeth) to masticate all their food; this leaves them only the effort of swallowing, which they do while lying comfortably by the fire.

There are no diseases peculiar to the Botocudo Indians. They have, however, been widely attacked by the deadly influenza and its complications, such as bronchitis, pneumonia, etc. They also suffer from rheumatism of the joints and muscles.

[47] The great ease with which their wounds are healed, even when extremely serious, is eminently worthy of note.

Venereal diseases of any sort are altogether unknown among them.

[163] Their high fecundity insures the perpetuation of the tribe.

224 This tribe subsists primarily on the proceeds of the hunt and is therefore nomadic, ever on the move through the woods in search of game. The tapir is preferred on account of the quantity and flavor of its flesh. It is hunted in the following way. The Indians look for a fresh spoor, set their dogs loose, and follow them on the run until the tapir is roused. Then they determine the direction taken by the animal, which always follows its habitual trails, known to the hunters; they take a shortcut through the woods and wait. Spurred on madly by the dogs, the tapir runs toward them and is attacked and killed with the spears.
